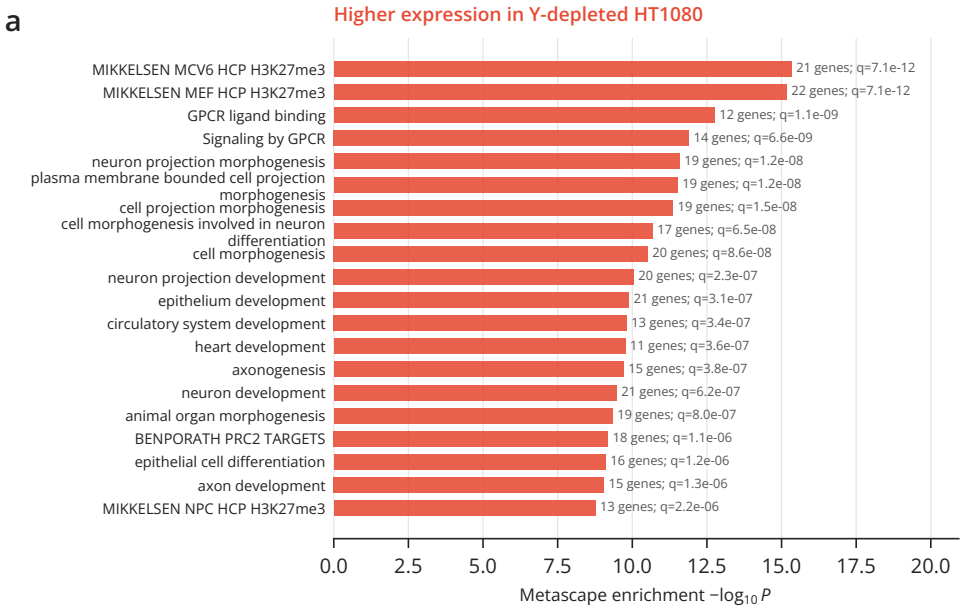
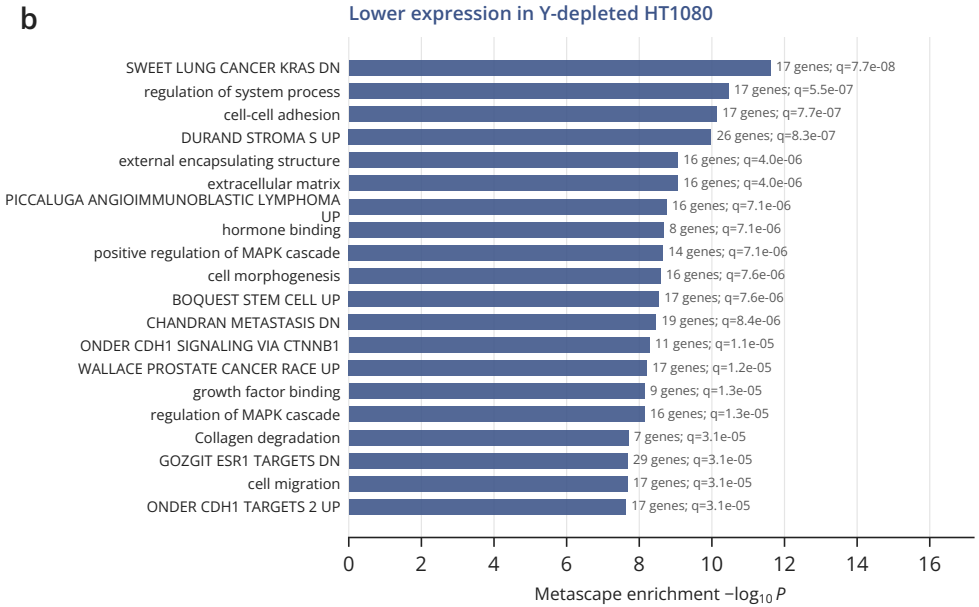
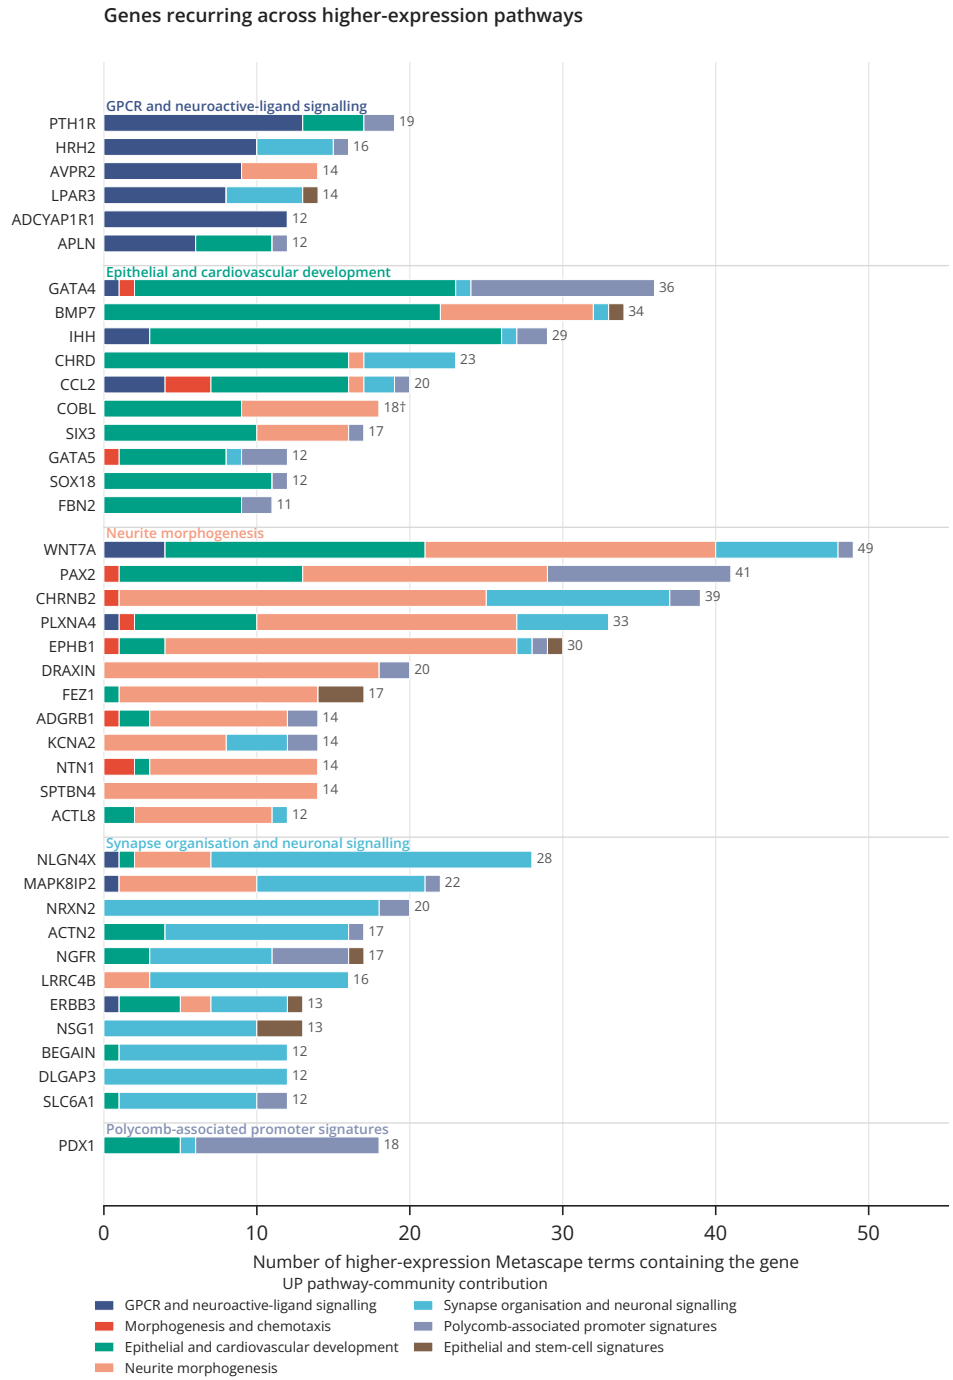
Metascape pathways and their recurrent contributing genes

Over-representation analysis of 229 higher- and 433 lower-expression genes; 25,461-gene tested background







a,b, Top 20 terms per direction ranked by nominal enrichment P; labels give input-list hits and Metascape q. c, Top 40 genes ranked by recurrence across UP terms and grouped by dominant pathway community. Pathway recurrence reflects overlapping annotations rather than expression magnitude. † Equal maxima in multiple modules.
