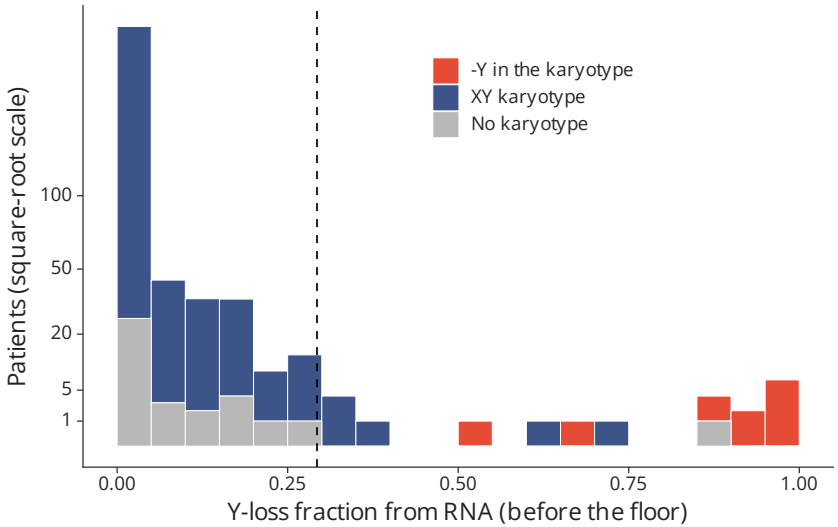
a

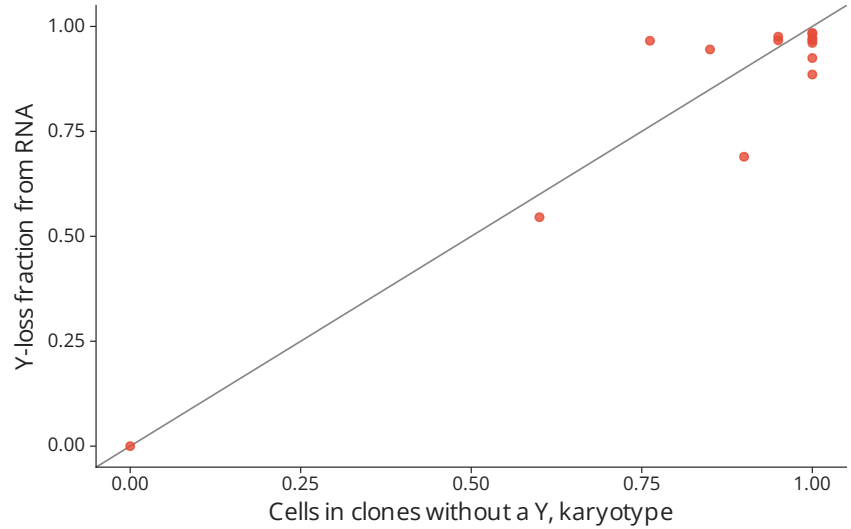
15 of 263 male patients have a Y-loss fraction of at least 0.5; 12 of them show -Y in the karyotype



One specimen per patient. Seven Y genes, each relative to its X partner and to the median male specimen. Dashed: floor at 0.29, below which the fraction is set to 0.

b

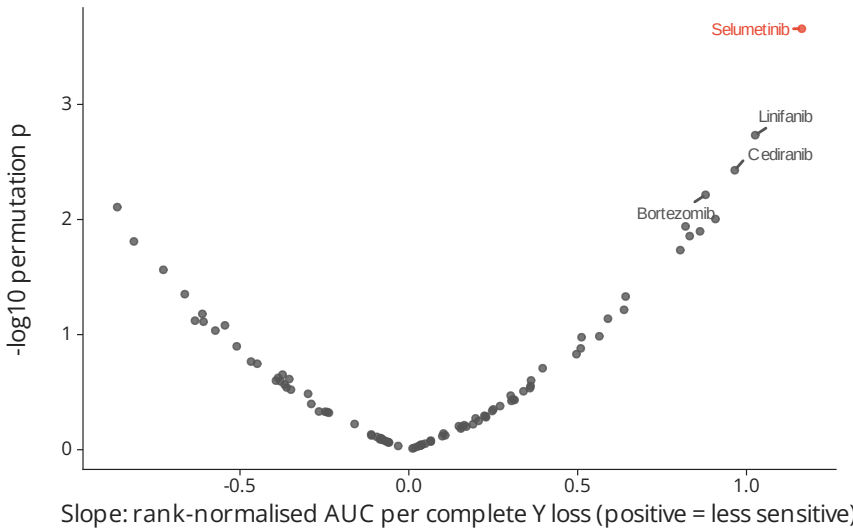
The RNA fraction follows the karyotype clone size in 14 specimens (rank correlation 0.57)



Male specimens whose karyotype mentions -Y. Line: equality. The karyotype counts dividing cells only.

c

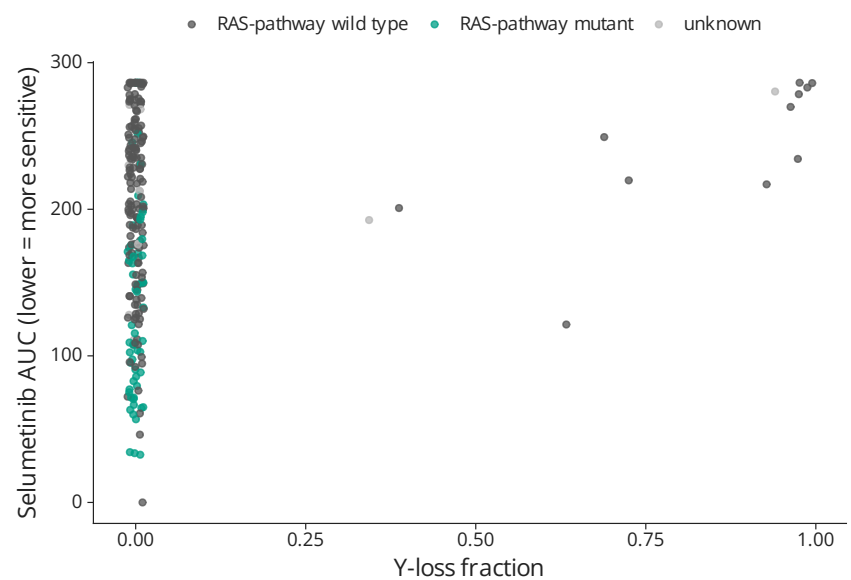
1 of 95 inhibitors passes: Selumetinib, less sensitive with Y loss



Up to 245 patients per inhibitor; specimen type, disease stage, age, core-binding-factor fusion and study wave adjusted; 100,000 Freedman-Lane permutations. Red: FDR < 0.05.

d

Selumetinib: no specimen with Y loss carries a RAS-pathway mutation, the group that responds best



226 patients. Slope 1.16 SD per complete Y loss (permutation p 2.2e-04); 0.79 with RAS-pathway mutation in the model (p 0.012), a check added after the result.
