HT1080 ATAC-seq: chromosome Y with chrX PAR1 signal

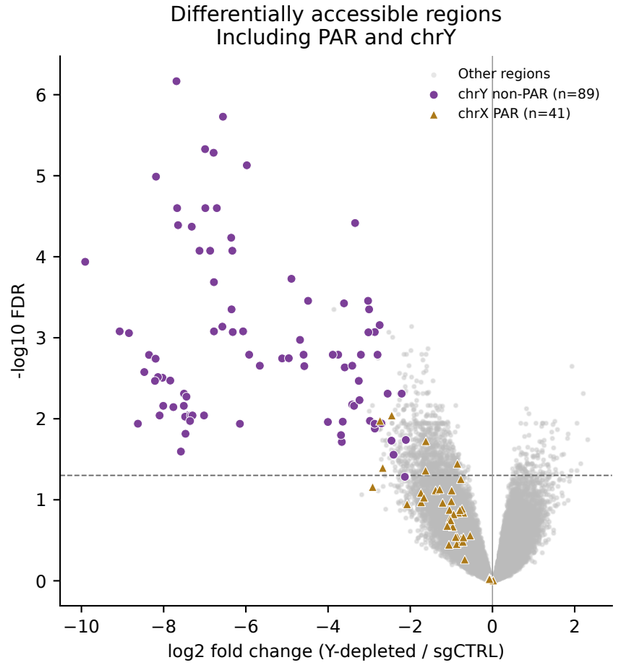

Mean fragment coverage per million accepted non-Y fragments; 10-kb bins. Each row is one library.

Whole chromosome Y | common signal scale

0-27 Mb detail | expanded Y-depleted scale

Left: identical 0-0.75 scale for all samples. Right: 0-0.75 for sgCTRL; 0-0.32 for Y-depleted.

FDR < 0.05
chrY non-PAR: 89 tested; 88 lower, 0 higher
chrX PAR: 41 tested; 6 lower, 0 higher
chrY PAR: 0 tested; 0 lower, 0 higher

edgeR quasi-likelihood model; 3 libraries/group.
Original TMM normalisation retained;
FDR recomputed across the expanded peak set.
chrY changes can reflect DNA depletion.
PAR points retain their alignment chromosome.

Existing MAPQ >=30, duplicate/QC and blacklist filters retained. No additional Y masking; reference gaps have no mapped signal.

Gold trace: chrX PAR1 coverage overlaid at homologous coordinates (not Y-specific). Shading: PAR1 / PAR2.
