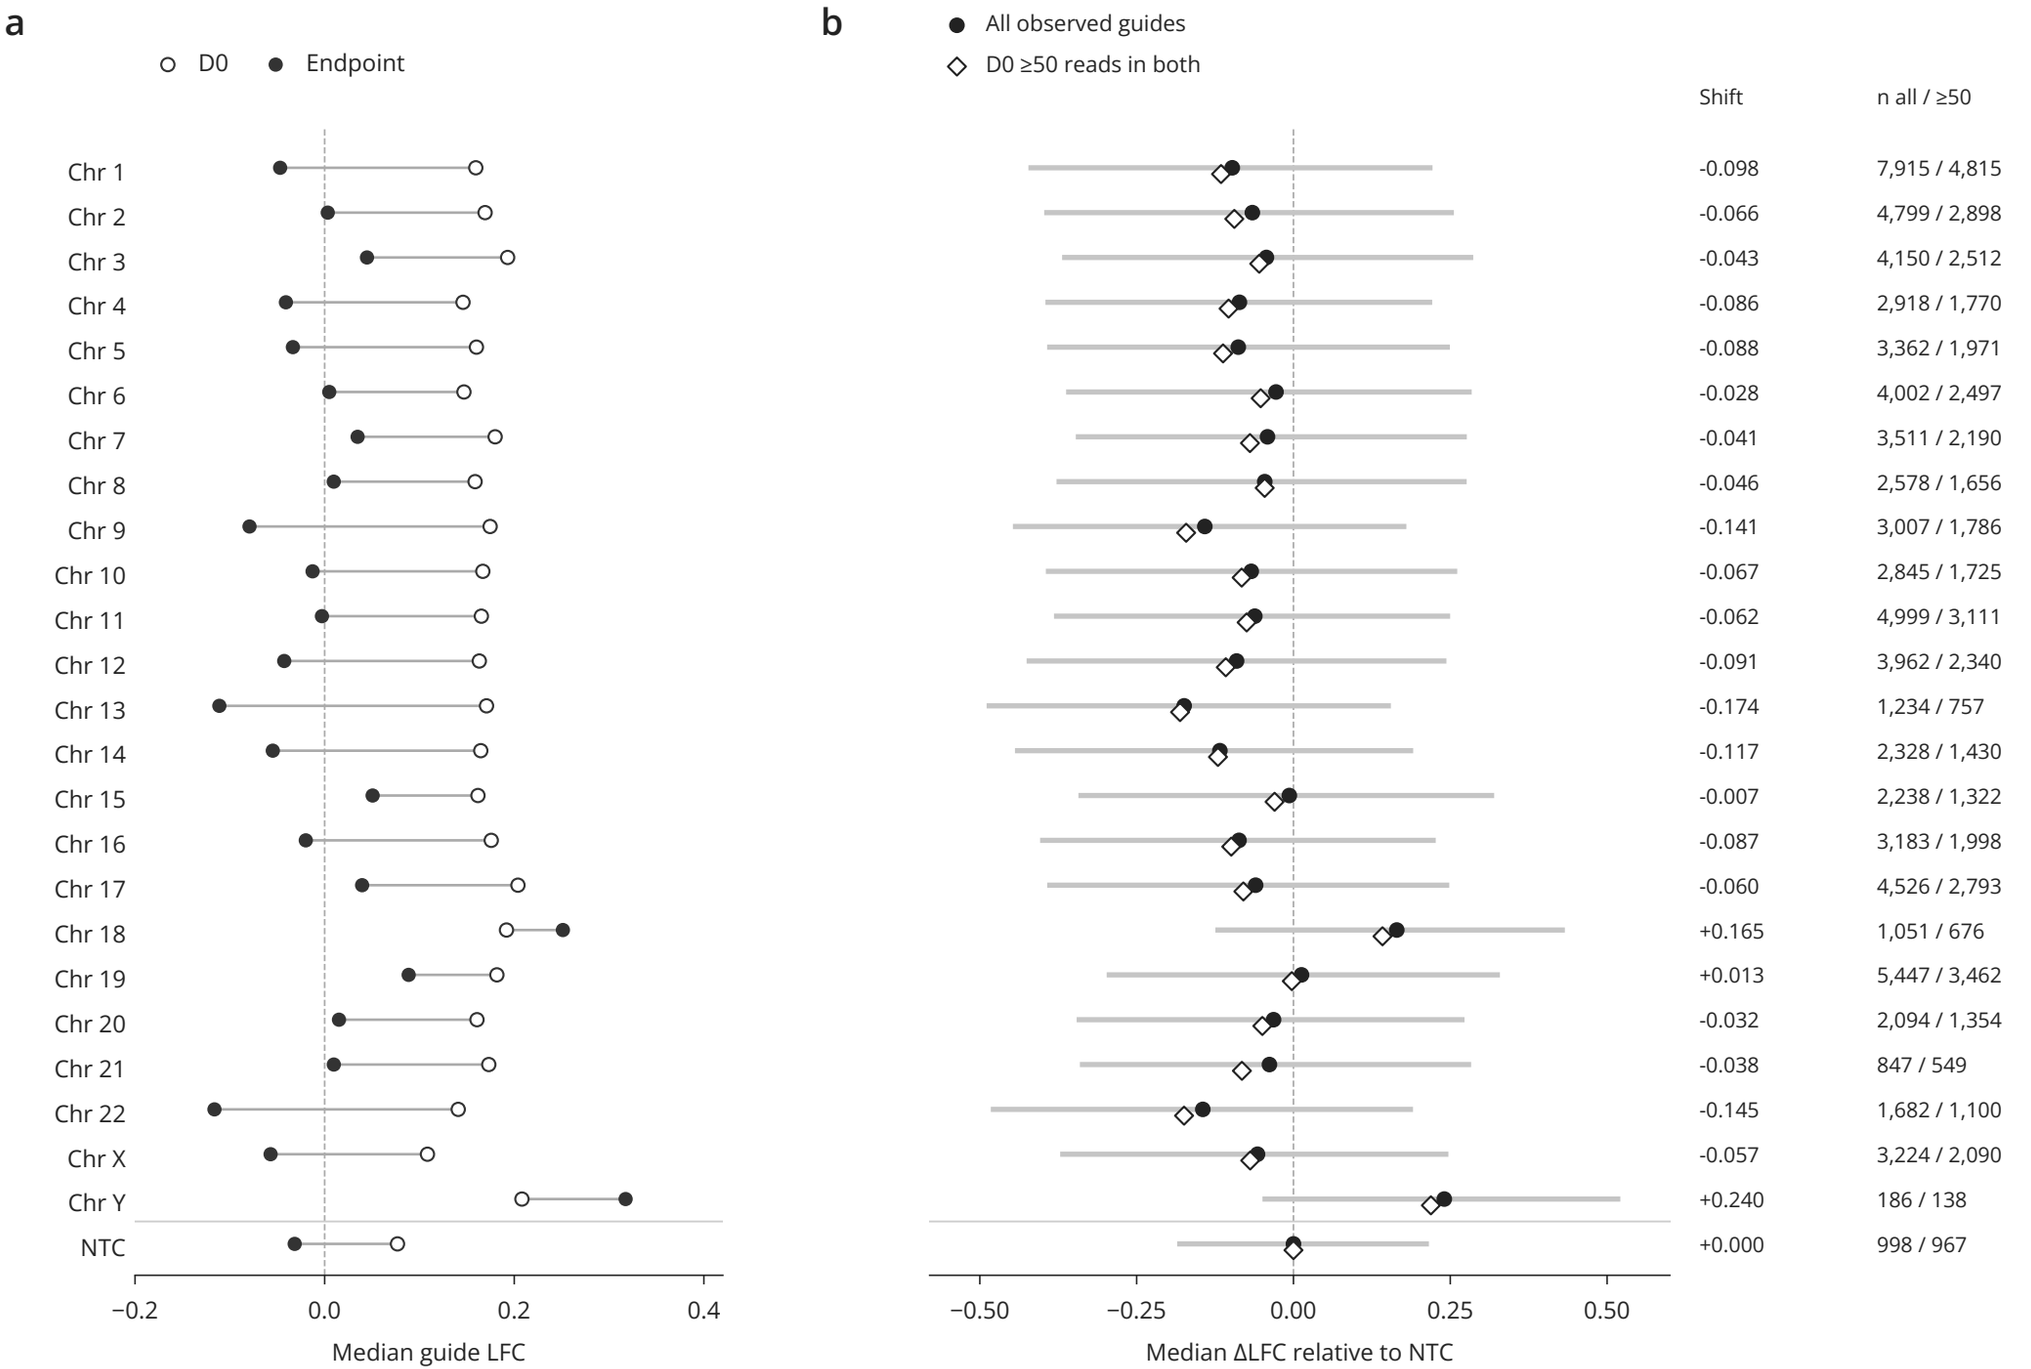
Chromosome-level summaries using matched CPM + 1 contrasts



ΔLFC = endpoint − D0 for each guide. Panel b subtracts the median NTC ΔLFC within each guide set.

Grey intervals: interquartile ranges of guide shifts, not confidence intervals. Diamonds: D0 read-threshold sensitivity.

NTC median ΔLFC: -0.108 (n = 998); ≥50 subset: -0.107.

Descriptive chromosome associations; no significance tests. Guide counts are not independent biological replicates.
